Assignment 7: GLMs (Linear Regressions, ANOVA, & t-tests)

PETER

SPRING 2025

OVERVIEW

This exercise accompanies the lessons in Environmental Data Analytics on generalized linear models.

Directions

1. Rename this file `<FirstLast>_A06_GLMs.Rmd` (replacing `<FirstLast>` with your first and last name).
2. Change "Student Name" on line 3 (above) with your name.
3. Work through the steps, **creating code and output** that fulfill each instruction.
4. Be sure to **answer the questions** in this assignment document.
5. When you have completed the assignment, **Knit** the text and code into a single PDF file.

Set up your session

1. Set up your session. Check your working directory. Load the tidyverse, agricolae and other needed packages. Import the *raw* NTL-LTER raw data file for chemistry/physics (`NTL-LTER_Lake_ChemistryPhysics_Raw.csv`). Set date columns to date objects.

2. Build a ggplot theme and set it as your default theme.

```
#1 Setup
#Check working directory
getwd()
```

```
## [1] "/home/guest/Assignments/EDA_Spring2025_TA"
```

```
#Import libraries
library(tidyverse);library(agricolae);library(lubridate);library(here);library(ggthemes)
```

```
## -- Attaching core tidyverse packages ------------------------ tidyverse 2.0.0 --
## v dplyr     1.1.4     v readr     2.1.5
## v forcats   1.0.0     v stringr   1.5.1
## v ggplot2   3.5.1     v tibble    3.2.1
## v lubridate 1.9.3     v tidyr     1.3.1
## v purrr     1.0.2
## -- Conflicts ------------------------------------------ tidyverse_conflicts() --
## x dplyr::filter() masks stats::filter()
## x dplyr::lag()    masks stats::lag()
## i Use the conflicted package (<http://conflicted.r-lib.org/>) to force all conflicts to become errors
## here() starts at /home/guest/Assignments/EDA_Spring2025_TA
```

```r
#Import data
NTL_LTER <- read.csv(here('Data/Raw/NTL-LTER_Lake_ChemistryPhysics_Raw.csv'),stringsAsFactors = T)

#Fix dates
NTL_LTER$sampledate = mdy(NTL_LTER$sampledate)

#Set ggplot theme
my_theme = theme_tufte() +
  theme(
    axis.line = element_line(color = "lightblue")
)
theme_set(my_theme)
```

Simple regression

Our first research question is: Does mean lake temperature recorded during July change with depth across all lakes?

3. State the null and alternative hypotheses for this question: > Answer: H0: Lake temperature in July does not change with depth Ha: Lake temperature in July changes with changes in depth
4. Wrangle your NTL-LTER dataset with a pipe function so that the records meet the following criteria:

- Only dates in July.
- Only the columns: `lakename`, `year4`, `daynum`, `depth`, `temperature_C`
- Only complete cases (i.e., remove NAs)

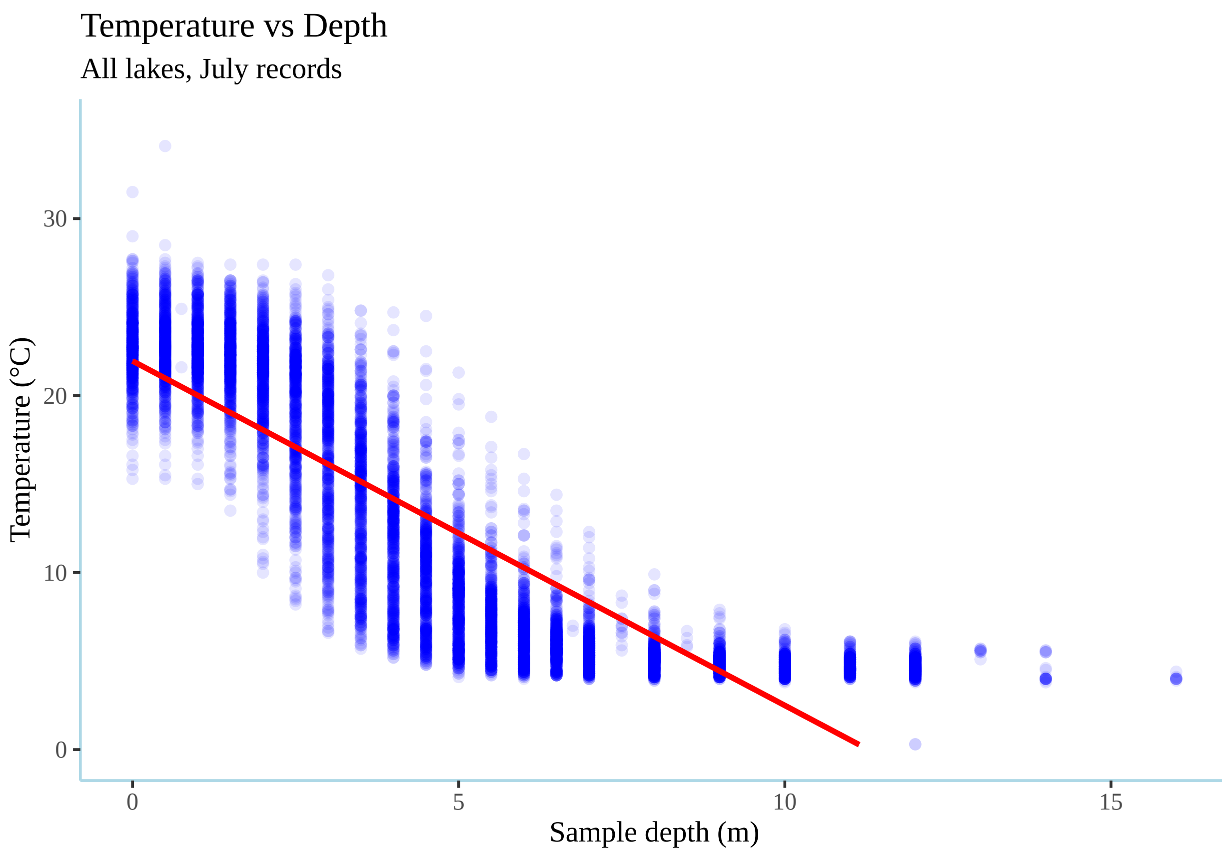
5. Visualize the relationship among the two continuous variables with a scatter plot of temperature by depth. Add a smoothed line showing the linear model, and limit temperature values from 0 to 35 °C. Make this plot look pretty and easy to read.

```r
#4 Wrangle
NTL_LTER_wrangled <-
  NTL_LTER %>%
  filter(month(sampledate) == 7) %>%
  select(lakename,year4,daynum,depth,temperature_C) %>%
  drop_na()

#5 Plot
NTL_LTER_wrangled %>%
  ggplot(aes(x=depth,y=temperature_C)) +
  geom_point(alpha=0.1,color='blue') +
  geom_smooth(method = 'lm',color='red') +
  ylim(0,35) +
  labs(
    x="Sample depth (m)",y="Temperature (°C)",
    title="Temperature vs Depth",
    subtitle="All lakes, July records")
```

```
## `geom_smooth()` using formula = 'y ~ x'
```

```
## Warning: Removed 24 rows containing missing values or values outside the scale range
## (`geom_smooth()`).
```



6. Interpret the figure. What does it suggest with regards to the response of temperature to depth? Do the distribution of points suggest about anything about the linearity of this trend?

   Answer: A noticeable trend of decreasing temperature with increasing depth. The points, however, appear to have a bit of a sigmoidal response vs a linear one.

7. Perform a linear regression to test the relationship and display the results

```
#7 Modeling
the_model <- lm(data=NTL_LTER_wrangled,formula= temperature_C ~ depth)
summary(the_model)
```

```
##
## Call:
## lm(formula = temperature_C ~ depth, data = NTL_LTER_wrangled)
##
## Residuals:
##     Min      1Q  Median      3Q     Max
## -9.5173 -3.0192  0.0633  2.9365 13.5834
##
## Coefficients:
```

```
##             Estimate Std. Error t value Pr(>|t|)
## (Intercept) 21.95597    0.06792   323.3   <2e-16 ***
## depth       -1.94621    0.01174  -165.8   <2e-16 ***
## ---
## Signif. codes:  0 '***' 0.001 '**' 0.01 '*' 0.05 '.' 0.1 ' ' 1
##
## Residual standard error: 3.835 on 9726 degrees of freedom
## Multiple R-squared:  0.7387, Adjusted R-squared:  0.7387
## F-statistic: 2.75e+04 on 1 and 9726 DF,  p-value: < 2.2e-16
```

8. Interpret your model results in words. Include how much of the variability in temperature is explained by changes in depth, the degrees of freedom on which this finding is based, and the statistical significance of the result. Also mention how much temperature is predicted to change for every 1m change in depth.

   Answer: July Lake temperature starts at a mean of 22°C and decreases with depth at a rate of 1.9°C per meter of depth. Increases in depth explain roughly 74% of the decrease in temperature, at a statistical significance of < 0.05 based on 9726 degrees of freedom.

Multiple regression

Let's tackle a similar question from a different approach. Here, we want to explore what might the best set of predictors for lake temperature in July across the monitoring period at the North Temperate Lakes LTER.

9. Run an AIC to determine what set of explanatory variables (year4, daynum, depth) is best suited to predict temperature.

10. Run a multiple regression on the recommended set of variables.

```r
#9 Multiple regression
#Run the regression
the_model <- lm(
  data = NTL_LTER_wrangled,
  formula = temperature_C ~ year4 + daynum + depth)

#Step through variables
step(the_model)
```

```
## Start:  AIC=26065.53
## temperature_C ~ year4 + daynum + depth
##
##          Df Sum of Sq    RSS   AIC
## <none>                141687 26066
## - year4   1       101 141788 26070
## - daynum  1      1237 142924 26148
## - depth   1    404475 546161 39189
```

```
##
## Call:
## lm(formula = temperature_C ~ year4 + daynum + depth, data = NTL_LTER_wrangled)
##
## Coefficients:
## (Intercept)        year4       daynum        depth
##    -8.57556      0.01134      0.03978     -1.94644
```

```r
#10 Recommended model
summary(the_model)
```

```
##
## Call:
## lm(formula = temperature_C ~ year4 + daynum + depth, data = NTL_LTER_wrangled)
##
## Residuals:
##     Min      1Q  Median      3Q     Max
## -9.6536 -3.0000  0.0902  2.9658 13.6123
##
## Coefficients:
##              Estimate Std. Error  t value Pr(>|t|)
## (Intercept) -8.575564   8.630715   -0.994  0.32044
## year4        0.011345   0.004299    2.639  0.00833 **
## daynum       0.039780   0.004317    9.215  < 2e-16 ***
## depth       -1.946437   0.011683 -166.611  < 2e-16 ***
## ---
## Signif. codes:  0 '***' 0.001 '**' 0.01 '*' 0.05 '.' 0.1 ' ' 1
##
## Residual standard error: 3.817 on 9724 degrees of freedom
## Multiple R-squared:  0.7412, Adjusted R-squared:  0.7411
## F-statistic:  9283 on 3 and 9724 DF,  p-value: < 2.2e-16
```

11. What is the final set of explanatory variables that the AIC method suggests we use to predict temperature in our multiple regression? How much of the observed variance does this model explain? Is this an improvement over the model using only depth as the explanatory variable?

    Answer: The stepwise AIC selection suggests that all three candidates for explanatory variables(depth, year4, and daynum) should be kept in the model that best fits the temperature data. The full model has the lowest AIC score at 26066. This model explains 74.1% of the variation in temperature, which is only a slight improvement over the depth-only model.

Analysis of Variance

12. Now we want to see whether the different lakes have, on average, different temperatures in the month of July. Run an ANOVA test to complete this analysis. (No need to test assumptions of normality or similar variances.) Create two sets of models: one expressed as an ANOVA models and another expressed as a linear model (as done in our lessons).

```r
#12
the_model_anova <- aov(
  data=NTL_LTER_wrangled,
  formula = temperature_C ~ lakename)
summary(the_model_anova)
```

```
##                Df Sum Sq Mean Sq F value Pr(>F)    
## lakename        8  21642  2705.2      50 <2e-16 ***
## Residuals    9719 525813    54.1                   
## ---
## Signif. codes:  0 '***' 0.001 '**' 0.01 '*' 0.05 '.' 0.1 ' ' 1
```

```r
the_model_glm <- lm(
  data=NTL_LTER_wrangled,
  formula = temperature_C ~ lakename)
summary(the_model_glm)
```

```
## 
## Call:
## lm(formula = temperature_C ~ lakename, data = NTL_LTER_wrangled)
## 
## Residuals:
##     Min      1Q  Median      3Q     Max 
## -10.769  -6.614  -2.679   7.684  23.832 
##

## 
## Residual standard error: 7.355 on 9719 degrees of freedom
## Multiple R-squared:  0.03953,    Adjusted R-squared:  0.03874 
## F-statistic:    50 on 8 and 9719 DF,  p-value: < 2.2e-16
```

13. Is there a significant difference in mean temperature among the lakes? Report your findings.

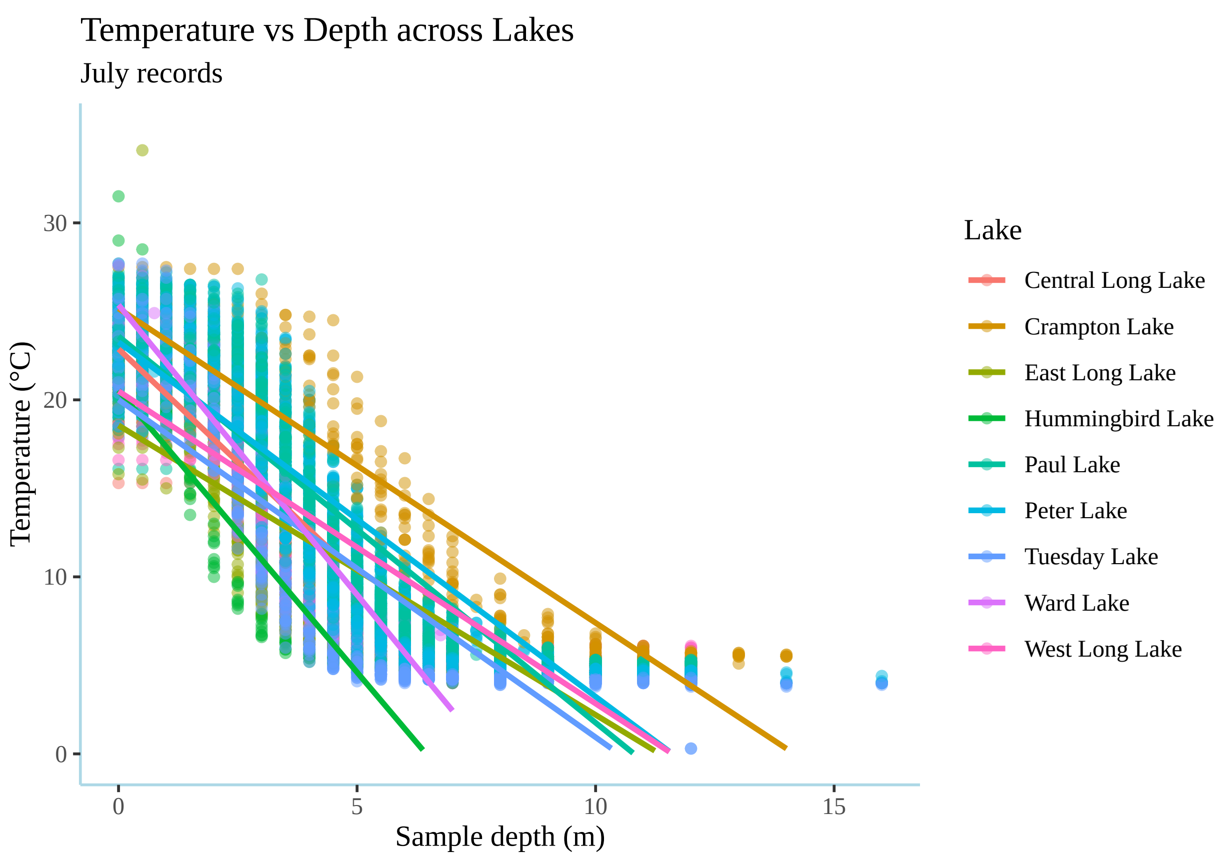
    Answer: The ANOVA result suggests we reject the null hypothesis that all means are equal, i.e., that at least one lake has a different mean July temperature ($p < 0.05$, DF = 9719). The linear model result confirms this, showing a sampling of lakes that have statistically different mean temperatures from each other.

14. Create a graph that depicts temperature by depth, with a separate color for each lake. Add a geom_smooth (method = "lm", se = FALSE) for each lake. Make your points 50 % transparent. Adjust your y axis limits to go from 0 to 35 degrees. Clean up your graph to make it pretty.

```r
#14.
NTL_LTER_wrangled %>%
  ggplot(aes(x=depth,y=temperature_C,color=lakename)) +
  geom_point(alpha=0.5) +
  ylim(0,35) +
  geom_smooth(method = 'lm', se=F) +
  labs(
    x="Sample depth (m)",
    y="Temperature (°C)",
    color="Lake",
    title="Temperature vs Depth across Lakes",
    subtitle="July records")
```

```
## `geom_smooth()` using formula = 'y ~ x'

## Warning: Removed 73 rows containing missing values or values outside the scale range
## (`geom_smooth()`).
```



15. Use the Tukey's HSD test to determine which lakes have different means.

```r
#15 Report honest significant difference
TukeyHSD(the_model_anova)
```

```
##   Tukey multiple comparisons of means
##     95% family-wise confidence level
##
## Fit: aov(formula = temperature_C ~ lakename, data = NTL_LTER_wrangled)
##
## $lakename

```

16.From the findings above, which lakes have the same mean temperature, statistically speaking, as Peter Lake? Does any lake have a mean temperature that is statistically distinct from all the other lakes?

> Answer: The HSD test indicates Crampton Lake has a statistically similar mean temperature as Central Long Lake and Crampton Lake. Also that Ward, Paul, and Peter Lakes are also similar to each other; West Long, Tuesday, and Hummingbird are the same; as is Tuesday, Hummingbird, and East Long. No lake has a statistically distinct mean July temperature.

17. If we were just looking at Peter Lake and Paul Lake. What's another test we might explore to see whether they have distinct mean temperatures?

> Answer: T-Test

18. Wrangle the data to filter the data for Crampton Lake and Ward Lake. Run the two-sample T-test on Crampton Lake and Ward Lake data. What does the test say? Are the mean temparature for the lakes equal? Does that match you answer for part 16?

```
Crampton_Ward <- NTL_LTER_wrangled %>%
  filter(lakename %in% c('Crampton Lake','Ward Lake'))

the_model_ttest <- t.test(Crampton_Ward$temperature_C ~ Crampton_Ward$lakename)
the_model_ttest
```

```
##
##  Welch Two Sample t-test
##
## data:  Crampton_Ward$temperature_C by Crampton_Ward$lakename
## t = 1.1181, df = 200.37, p-value = 0.2649
## alternative hypothesis: true difference in means between group Crampton Lake and group Ward Lake is n
## 95 percent confidence interval:
##  -0.6821129  2.4686451
## sample estimates:
## mean in group Crampton Lake     mean in group Ward Lake
##                    15.35189                    14.45862
```

Answer: The p-value of the two sample t-test is 0.2649, so we accept H0 and conclude that the means are teh same. This is in accordance to the results from part 15 and 16.
